

# Lattice Boltzmann from the perspective of classic kinetic theory

Xiaowen Shan

Exa Corp.  
Burlington, MA, USA

January 19, 2010

## Motivation

### Lattice Boltzmann from kinetic theory

Grad 13-moment system

Moments and discrete velocities

Doing moment expansion with discrete velocities

Hydrodynamics

### Ramifications and Prospects

Old problems solved

Compressible flows

Beyond Navier-Stokes

# LBGK: The conventional wisdom

- ▶ The lattice BGK Equation

$$f_i(\mathbf{x} + \mathbf{e}_i, t + 1) - f_i(\mathbf{x}, t) = -\frac{1}{\tau} \left[ f - f^{(eq)} \right]$$

- ▶ Equilibrium distribution function

$$f_i^{(eq)} = w_p \rho \left\{ 1 + \frac{\mathbf{e}_i \cdot \mathbf{u}}{c_s^2} + \frac{1}{2} \left[ \frac{(\mathbf{e}_i \cdot \mathbf{u})^2}{c_s^4} - \frac{u^2}{c_s^2} \right] \right\}$$

- ▶ Velocities on a lattice
- ▶ Navier-Stokes with sound speed  $c_s^2 = 1/3$

# Recovery of Navier-Stokes

- ▶ Single-relaxation-time collision model.
- ▶  $f^{(eq)}$  ensures Chapman-Enskog yields Navier-Stokes
- ▶ Cartesian lattice <sup>1</sup>:

$$f_i^{(eq)} = w_p \rho \left\{ 1 + \frac{\mathbf{e}_i \cdot \mathbf{u}}{c_s^2} + \frac{1}{2} \left[ \frac{(\mathbf{e}_i \cdot \mathbf{u})^2}{c_s^4} - \frac{u^2}{c_s^2} \right] \right\}$$

- ▶ Hexagonal lattice <sup>2</sup>:

$$f_i^{(eq)} = w_p \rho \left\{ \delta + |\mathbf{e}_i| (1 - 2\delta) + D \frac{\mathbf{e}_i \cdot \mathbf{u}}{c^2} + \frac{1}{2} \left[ D(D + 2) \frac{(\mathbf{e}_i \cdot \mathbf{u})^2}{c^4} - D \frac{u^2}{c^2} \right] \right\}$$

- ▶ Most of the lattice artifacts eliminated.
- ▶ CFD applications for near-incompressible isothermal flows.

<sup>1</sup>Qian et al, *Europhys. Lett.*, **17**, 479, (1992)

<sup>2</sup>Chen et al, *Phys. Rev. A*, **45**, R5339, (1992)

# Lattice Boltzmann BGK: Issues

- ▶ Not exactly Navier-Stokes, Viscosity depend on velocity <sup>3</sup>
- ▶ Thermal model numerically unstable  
more velocities help, but “one does not know off hand by what criterion to determine the additional velocities” <sup>4</sup>
- ▶ Lattice dependent: macroscopic equations obtained through tedious discrete-velocity Chapman-Enskog analysis.
- ▶ Not clear how to extend beyond Navier-Stokes
- ▶ Is it a lucky accident?

---

<sup>3</sup>Qian & Orszag, *Europhys. Lett.*, **21**, 255, (1993)

<sup>4</sup>McNamara *et al*, *J. Stat. Phys.*, **87**, 1111, (1997)

## LBGK: Link to kinetic theory

- ▶ Abe<sup>5</sup> and He<sup>6</sup> derived the D2Q9 models by noticing that the LBGK equilibrium distribution is the Taylor expansion of the Maxwellian in velocity, evaluated on abscissas of Gauss-Hermite quadrature:

$$f^{(eq)} = \frac{\rho}{(2\pi RT)^{D/2}} \exp\left(-\frac{\xi^2}{2RT}\right) \left[1 + \frac{\boldsymbol{\xi} \cdot \mathbf{u}}{RT} + \frac{(\boldsymbol{\xi} \cdot \mathbf{u})^2}{2(RT)^2} - \frac{u^2}{2RT}\right]$$

- ▶ Abe also approximated the distribution by essentially:

$$f = \frac{\rho}{(2\pi RT)^{D/2}} \exp\left(-\frac{\xi^2}{2RT}\right) [a_0 + \mathbf{a}_1 \cdot \boldsymbol{\xi} + (\mathbf{a}_2 \cdot \boldsymbol{\xi})^2]$$

- ▶ The lowest terms of a Hermite expansion.
- ▶ Similar to Grad moment expansion theory.

<sup>5</sup>Abe, *J. Comp. Phys.*, **131**, 241, (1997)

<sup>6</sup>He & Luo, *Phys. Rev. E*, **55**, R6333, (1997)

# LB via Hermite expansion <sup>7</sup>

Lattice Boltzmann scheme derived from kinetic theory based on two observations:

- ▶ Only interested in the leading moments of the distribution. Huge complexity reduction from a 3-dimensional function to a handful of scalars.
- ▶ For finite Hermite expansion, leading moments and discrete function values are isomorphic.

---

<sup>7</sup>Shan & He, *Phys. Rev. Lett.*, **80**, 65, (1998); Shan et al *J Fluid Mech*, **550**, 413 (2006)

# Outline

### Grad 13-moment system

Moments and discrete velocities

Doing moment expansion with discrete velocities

Hydrodynamics

## Ramifications and Prospects

Old problems solved

Compressible flows

Beyond Navier-Stokes

# Hermite polynomials

- ▶ Eigen-function of a Sturm-Liouville equation:

$$H_n''(x) - xH_n'(x) + nH_n(x) = 0.$$

- ▶ Explicitly:

$$H_n(x) = \frac{(-1)^n}{\omega(x)} \frac{d^n \omega(x)}{dx^n} \quad \text{where} \quad \omega(x) = \frac{1}{\sqrt{2\pi}} \exp\left[-\frac{x^2}{2}\right]$$

- ▶ First few polynomials:

$$H_0(x) = 1, \quad H_1(x) = x, \quad H_2(x) = x^2 - 1, \quad H_3(x) = x^3 - 3x, \dots$$

# Properties

- ▶ Orthogonality

$$\int_{-\infty}^{\infty} \omega(x) H_n(x) H_m(x) dx = n! \delta_{nm}$$

- ▶ Generalized Fourier expansion:

$$f(x) = \omega(x) \sum_{n=0}^{\infty} \frac{1}{n!} a_n H_n(x) \quad \text{where} \quad a_n = \int_{-\infty}^{\infty} f(x) H_n(x) dx$$

for all “square-integrable” functions:

$$\int_{-\infty}^{\infty} \omega(x) |f(x)|^2 dx$$

## In higher dimensions <sup>8</sup>

- ▶ The  $D$ -dimensional Hermite polynomials:

$$\mathcal{H}^{(n)}(\boldsymbol{\xi}) = \frac{(-1)^n}{\omega(\boldsymbol{\xi})} \nabla^n \omega(\boldsymbol{\xi}) \quad \text{where} \quad \omega(\boldsymbol{\xi}) = \frac{1}{(\sqrt{2\pi})^D} \exp\left[-\frac{\boldsymbol{\xi}^2}{2}\right]$$

- ▶  $\mathcal{H}^{(n)}(\boldsymbol{\xi})$ : rank- $n$  tensor and degree- $n$  polynomial in  $\boldsymbol{\xi}$

$$\mathcal{H}^{(0)}(\boldsymbol{\xi}) = 1, \quad \mathcal{H}^{(1)}(\boldsymbol{\xi})_i = \xi_i, \quad \mathcal{H}^{(2)}(\boldsymbol{\xi})_{ij} = \xi_i \xi_j - \delta_{ij}, \quad \dots$$

- ▶ Hermite expansion in multi-dimensions:

$$f(\boldsymbol{\xi}) = \omega(\boldsymbol{\xi}) \sum_{n=0}^{\infty} \frac{1}{n!} \mathbf{a}^{(n)} \mathcal{H}^{(n)}(\boldsymbol{\xi}) \quad \text{where} \quad \mathbf{a}^{(n)} = \int f(\boldsymbol{\xi}) \mathcal{H}^{(n)}(\boldsymbol{\xi}) d\boldsymbol{\xi}$$

- ▶ Expansion coefficients are the moments

$$\mathbf{a}^{(0)} \equiv \rho, \quad \mathbf{a}^{(1)} \equiv \rho \mathbf{u}, \quad \mathbf{a}^{(2)} \equiv \mathbf{P} + \rho \mathbf{u} \mathbf{u} - \rho \boldsymbol{\delta}, \quad \mathbf{a}^{(3)} \equiv \mathbf{Q} + \dots$$

# Grad 13-moment system

Hermite (moment) expansion of Boltzmann equation <sup>9</sup>

- ▶ State variable: leading moments:  $\rho$ ,  $\mathbf{u}$ ,  $\mathbf{P}$ ,  $\mathbf{q}$ . (or more)
- ▶ Hermite coefficients correspond to the moments
- ▶ Projection into a subspace spanned by leading polynomials
- ▶ Spectral method in velocity space
- ▶ Closure at an higher level.
- ▶ Complicated PDE in space-time, hard to compute

---

# Outline

## Motivation

### Lattice Boltzmann from kinetic theory

Grad 13-moment system

Moments and discrete velocities

Doing moment expansion with discrete velocities

Hydrodynamics

### Ramifications and Prospects

Old problems solved

Compressible flows

Beyond Navier-Stokes

# “Isomorphism” between moments and discrete velocities

- ▶ Gauss-Hermite quadrature:

$$\int \omega(\xi) p(\xi) d\xi = \sum_{i=1}^d w_i p(\xi_i), \quad \text{for polynomial } p$$

- ▶ Moments of a finite Hermite expansion:

$$\int f(\xi) \xi^m d\xi = \int \omega(\xi) \left[ \frac{f(\xi)}{\omega(\xi)} \xi^m \right] d\xi$$

- ▶ Integrand is a polynomial with an order  $\leq n + m$ .
- ▶ In a finite Hermite space, moments and discrete-velocity distribution functions are isomorphic.
- ▶ Recovering LB:

$$\rho = \sum_{i=1}^d f_i, \quad \rho \mathbf{u} = \sum_{i=1}^d f_i \xi_i, \quad \dots, \quad \text{where } f_i \equiv \frac{w_i f(\xi_i)}{\omega(\xi_i)}$$

# Outline

## Motivation

### Lattice Boltzmann from kinetic theory

Grad 13-moment system

Moments and discrete velocities

Doing moment expansion with discrete velocities

Hydrodynamics

### Ramifications and Prospects

Old problems solved

Compressible flows

Beyond Navier-Stokes

# BGK projected into low-dimensional subspace

- ▶ Second-order Hermite expansion of Maxwellian:

$$f^{(0)}(\boldsymbol{\xi}) = \rho\omega \left\{ 1 + \mathbf{u} \cdot \boldsymbol{\xi} + \frac{1}{2} [(\mathbf{u} \cdot \boldsymbol{\xi})^2 - u^2 + (\theta - 1)(\xi^2 - D)] \right\}$$

- ▶ No assumption of small Mach number
  - ▶ Temperature included
- ▶ Second-order Hermite expansion of the body force ( $\mathbf{g} \cdot \nabla_{\boldsymbol{\xi}} f$ ):

$$F(\boldsymbol{\xi}) = -\rho\omega [\mathbf{g} \cdot \boldsymbol{\xi} + (\mathbf{g} \cdot \boldsymbol{\xi})(\mathbf{u} \cdot \boldsymbol{\xi}) - \mathbf{g} \cdot \mathbf{u}]$$

- ▶ Discrete-velocity distribution solved from projected BGK

Hydrodynamics

### Ramifications and Prospects

Old problems solved

Compressible flows

Beyond Navier-Stokes

# Chapman-Enskog

With BGK, CE approximation is essentially:

$$f^{(1)} \cong -\tau \left[ \frac{\partial}{\partial t} + \boldsymbol{\xi} \cdot \nabla + \mathbf{g} \cdot \nabla_{\boldsymbol{\xi}} \right] f^{(0)}$$

Hermite expansion coefficients of  $f^{(1)}$ :

$$\mathbf{a}_1^{(n)} = -\tau \left[ \frac{\partial \mathbf{a}_0^{(n)}}{\partial t} + \nabla \mathbf{a}_0^{(n-1)} + \nabla \cdot \mathbf{a}_0^{(n+1)} - \mathbf{g} \mathbf{a}_0^{(n-1)} \right].$$

- ▶ First  $n$  moments of  $f^{(1)}$  given by first  $n+1$  moments of  $f^{(0)}$ .
- ▶ First  $n$  moments of  $f^{(k)}$  given by first  $n+k$  moments of  $f^{(0)}$ .

Same as continuum BGK iff leading moments of  $f^{(0)}$  matches!

# Summary

- ▶ LBGK approximates continuum BGK (Not near-incompressible NS)
- ▶ Accuracy:  
Let  $Q$  be quadrature precision,  $N$ : truncation order of  $f^{(0)}$ . To recover the dynamics of the first  $M$  moments:

$$N \geq M \quad \text{and} \quad Q \geq M + N \quad \Rightarrow \quad Q \geq 2M.$$

Can't use Maxwellian in LBGK

- ▶ many problems due to insufficient truncation
- ▶ Analogous to pseudo-spectral method (moment method analogous to spectral)

### Ramifications and Prospects

Old problems solved

Compressible flows

Beyond Navier-Stokes

# Galilean invariance

- ▶ Galilean invariance restored in pressure, but not in viscosity.
- ▶ Also known as the “cubic” dependency on velocity (Ma). <sup>10</sup>
- ▶ Efforts in correcting the “cubic” error <sup>11</sup>
- ▶ Root cause: insufficient truncation and lattice accuracy. <sup>12</sup>
- ▶ Correct viscosity:  $Q \geq 6$ ; thermal diffusivity:  $Q \geq 8$ .
- ▶  $DxQx$ :  $N = 2$  or  $3$  and  $Q = 5$ . Not enough for  $M = 3$ .

Old problems solved

**Compressible flows**

Beyond Navier-Stokes

# The obstacles and solutions

Previous challenges:

- ▶ Equilibrium is an iso-thermal small-velocity expansion
- ▶ Errors at finite Mach number
- ▶ Thermal model constructed *ad hoc*.

In the new approach:

- ▶ Moment expansion independent of Mach number
- ▶ Clear criteria to fully recover NS energy equations

# Flow past a $15^\circ$ wedge (Static pressure)

Figure: Shear wave decay rate at different Weissenberg number by LBGK models of different orders.

# Non-Ideal gases LBGK model

- ▶ Inter-particle interaction ignored in Boltzmann equation. One has to go to the next equation in BBGKY <sup>14</sup>:

$$\frac{\partial f_1}{\partial t} + \boldsymbol{\xi}_1 \cdot \nabla_{\mathbf{r}_1} f_1 = \int \nabla_{\boldsymbol{\xi}_1} f_2 \cdot \nabla_{\mathbf{r}_1} V(|\mathbf{r}_1 - \mathbf{r}_2|) d\boldsymbol{\xi}_2 d\mathbf{r}_2$$

- ▶ Leading order effect: a self-consistent mean-field body force:

$$\mathbf{a} \cdot \nabla_{\boldsymbol{\xi}} f \quad \text{where} \quad \mathbf{a} = \int \rho(\mathbf{r}_2) g(\mathbf{r}_1, \mathbf{r}_2) \nabla_{\mathbf{r}_1} V(|\mathbf{r}_1 - \mathbf{r}_2|) d\mathbf{r}_2$$

- ▶ Shan-Chen model reinvented
- ▶ Link between the “pseudo-potential” and the pair-wise potential <sup>15</sup>.

<sup>14</sup> Martys, *Int. J. Mod. Phys. C*, **10**, 1367, (1999); He & Doolen, *J. Stat. Phys.*, **107**, 309, (2002); Martys, *Physica A*, **362**, 57, (2005)
